

Food Delivery Analytics

Interactive Business Analysis using Tableau

PREPARED BY	Purva Rahul Yenpure
DEPARTMENT	Artificial Intelligence & Data Science
ACADEMIC YEAR	2026–27
TOOL	Tableau
DATASET	Food Delivery Analytics Dataset – 1,000 orders

Project at a Glance

1,000 Food delivery orders analysed	9 Visualizations created	3 Stakeholder dashboards	37.59 Average delivery time (min)
---	--	--	---

01 Introduction

The food delivery industry is highly competitive and generates large volumes of data on customer orders, cuisines, cities, meal types, spending, and delivery performance. This project uses **Tableau** to transform food ordering data into interactive visualizations and meaningful business insights.

02 Problem Statement

Businesses need to understand order demand, customer spending patterns, cuisine preferences, peak meal periods, and delivery efficiency. The challenge is to convert raw data into clear information that supports business and operational decisions.

03 Objectives

- 1Analyse order demand across different cities.
- 2Identify popular cuisines and meal types.
- 3Analyse order value and customer spending patterns.
- 4Study delivery-time distribution and city-wise delivery performance.
- 5Develop interactive dashboards for different stakeholders.
- 6Generate actionable recommendations.

04 Dataset Description

The dataset contains **1,000 food delivery orders**. Each record represents a single order and includes information about the order, location, cuisine, meal period, spending, delivery fee, and delivery duration. It is maintained in CSV format.

Dataset Attributes

Attribute	Description
Order ID	Unique order identifier
Order Date / Order Time	Date and time the order was placed
City	Order location
Cuisine	Cuisine category
Meal Type	Breakfast, Lunch, Snacks, or Dinner
Order Value	Value of the food order
Delivery Fee	Delivery charge
Time Taken for Delivery	Delivery duration in minutes
Total Customer Spend	Order value plus delivery fee

05 Tools and Technologies

Tableau was used for data connection, calculated fields, visualization, dashboard design, filtering, and interactive analysis. GitHub is used for project sharing, and Tableau Public can host the interactive demo.

06 Data Preparation and Calculated Measures

The CSV dataset was connected to Tableau and its fields were checked before visualization. The following preparation steps were carried out:

- Calculated measures created for **Total Orders**, **Total Order Value**, **Average Order Value**, and **Average Delivery Time**.
- Distinct order counting used where appropriate.
- Delivery time grouped into bins for distribution analysis.

07 Visualizations Created

Nine worksheets were built and then combined into stakeholder-specific dashboards:

01 Orders by City	02 Cuisine Analysis	03 Meal Type Analysis
04 Order Value by Cuisine	05 Demand Trend	06 Delivery Time by City
07 Delivery Time Distribution	08 Meal Type vs Delivery Type	09 Order Value vs Delivery Time

08

Stakeholder Dashboards

Rahul

Business Analyst

FOCUS

Order demand, cuisine preferences, meal types, cities, and spending.

CHARTS

- Orders by City
- Cuisine Analysis
- Meal Type Analysis
- Order Value by Cuisine
- Demand Trend

KPI CARDS

- Total Orders
- Total Order Value
- Average Order Value

Priya

Operations Manager

FOCUS

Delivery efficiency and workload.

CHARTS

- Delivery Time by City
- Orders by City
- Delivery Time Distribution
- Meal Type vs Delivery Type

KPI CARDS

- Total Orders
- Average Delivery Time
- Average Delivery Fee

Neha

Regular Customer

FOCUS

Convenience, reasonable pricing, cuisine variety, and timely delivery.

CHARTS

- Cuisine Analysis
- Meal Type Analysis
- Order Value by Cuisine
- Delivery Time by City
- Order Value vs Delivery Time

Interactivity

Dashboard filters and actions let users select cities, cuisines, and meal types and see the matching information update across every visualization. This supports exploration from an overall view down to focused analysis.

09

Key Findings

Mumbai

Highest order volume

Dinner

Highest-demand meal period

37.59 min

Average delivery time

Chennai

Highest average delivery time among cities

Fast Food

Most popular cuisine

Biryani

Highest average order value

35–40 min

Range where most orders are concentrated

Variable

Demand shows periods of higher and lower activity

10 Recommendations

#	Recommendation	Supported by
1	Increase delivery capacity and partner availability in high-demand cities.	Mumbai has the highest order volume
2	Allocate additional delivery resources during dinner hours.	Dinner is the highest-demand meal period
3	Maintain adequate availability for popular cuisines.	Fast Food is the most popular cuisine
4	Focus on reducing delivery delays around the common 35–40 minute range.	Most orders fall in this range
5	Improve delivery efficiency during peak periods to support customer satisfaction.	Demand varies over time; Chennai is slowest on average

11 Conclusion

The project shows how Tableau can turn food delivery data into meaningful business intelligence. **Rahul's** dashboard focuses on demand and spending, **Priya's** on operational efficiency, and **Neha's** on customer experience. Together, the findings give practical direction for resource allocation, service efficiency, and customer satisfaction.

12 Future Scope

The project can be extended with the following:

Customer ratings	Discounts	Restaurant information
Payment methods	Repeat-order indicators	Traffic and weather data
Geographic maps	Demand forecasting models	Delivery-delay prediction

13

Project Deliverables

Deliverable	Description
Dataset	Food delivery order dataset in CSV format
Tableau Workbook	Workbook containing worksheets and interactive dashboards
Dashboards	Rahul – Business Analysis; Priya – Operations Analysis; Neha – Customer Experience
Report	Project documentation covering methodology, findings, and recommendations
Demo	Tableau Public interactive visualization link, if published
